

- == operator compares variables and adjusts for datatype  
=== compares both variable content and datatype
- Haverbeke: a closure is a function that can reference bindings from local scopes around. Further on, a closure has access to global variables, its own scope and the outer function variables
- Higher order function are functions that can either take or return other functions and therefore operate on them (Haverbeke)
- A query selector returns an element which matches a given CSS selector on a document.

From W3schools:

```
var x = document.getElementById("myDIV");  
x.querySelector(".example").innerHTML = "Hello World!";
```
